## CAPPEC Releases the Glow Food Thermometer

CAPPEC, a leader in innovative and cutting-edge thermometer technology, announced the release of Glow, an easy-to-read digital food thermometer packed with useful features. With programmable alerts, large backlit LCD screen, and extended probe, this device is the perfect complement to both home and professional kitchens.

According to Michael Jensen, CAPPEC's founder, *"Glow is our latest attempt to produce a product based on the feedback of our users. We've integrated extreme low tolerance components to ensure ultra fast, and accurate readings, while keeping settings intuitive. Readings are very easily displayed on our new high-end LCD with a bright orange backlight."*

Users are able to select from a list of temperatures based on what they are cooking, set custom timers, and monitor ambient heat. In addition, the Glow utilizes both high and low alerts, ensuring you never over or undercook a dish again. Once the unit is on and the alerts are set, the oversized LCD let's you track the progress with a quick glance, allowing you to focus your attention elsewhere. *"We understand the professional as well as the house chef should turn their attention to the taste of the food and not on a thermometer, therefore we let people choose any type of temperature setting high or low to let people enjoy the wonders of cooking "* said Jensen.

CAPPEC was founded in 2013 and is headquartered in Hong Kong. They have designed and manufactured some of the top food thermometers on the market, including the Blaze and Flare.
